Michael Penhallegon

Week 3 Summary

This week I have been working through the other half of the second chapter of the *Data Analysis for Life Sciences* book. Last week, at my check-in with Richard, I was confused on the question of what Monte Carlo or Resampling distributions conceptually is. I am working on providing a presentation that I will share next week.

As I mentioned last week, I needed to work on some more exercises of chapter 2 and have one more set written up. I feel like I need to quicken up the speed, admittedly this week was not as productive as I wanted to homework-wise. I have gone through and refocused on making more time to work on this work this next week.

Submitting to EdX

Next week, on January 30th, the EdX courses will reopen and I can hit the ground running submitting things for certificates.

Synthesis

As a combination of slow progress on the second chapter content and the late opening of the EdX content, I feel like I am falling behind on getting to a synthesis component, I will be planning what to do to connect this work back to my research work next week.
